## Temperatures This Morning **Snow Cover This Morning Arctic Pool** -40 -30 -20 -10 O Canadian Temperatures This AM **Polar Vortex** Jet Stream Early Next Week Polar Vortex Jet Stream Late Next Week Arctic Polar Temperature Anomalies Late Next Week

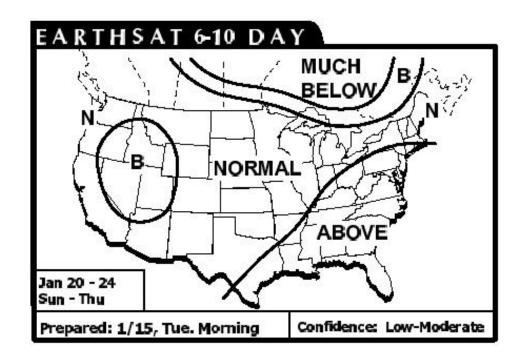

## **Executive Summary**

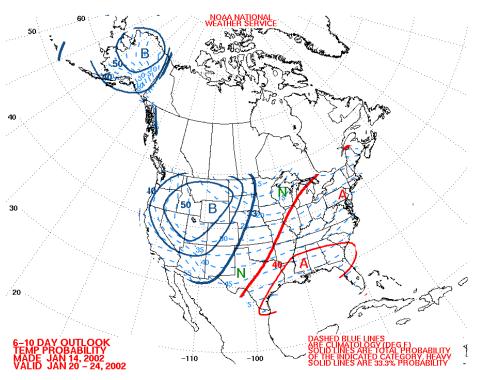

Market Movers for Tuesday, January 15, 2002; 7:00am CT

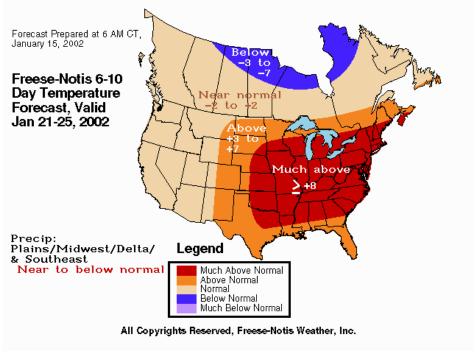

## ...Contained Cold...

- Overview -> Contained Canadian Cold: The Polar Vortex is shifting into Canada and cold air is spreading from Alaska across Central Canada. This week will feature the beginning of a stormy U.S. weather pattern but there remain no signs of a mechanism to transport cold air very far south. The pattern theme is that Canada will get cold during the next two weeks but there will only be limited opportunities for any of this cold to sink into the U.S. and what cold does penetrate the border will not track very far south and will not be strong to severe The primary threat for colder than normal temperatures over the next two weeks will focus across the Rockies and West while the Midwest and East remain mild to warm.
- Models/Teleconnections/Pattern -> Typical Winter Pattern: Models are beginning to show a split in the theme for the overall pattern beginning latae next week and continuing into late January. Today's operational American model along with a number of ensemble members try to force a fast moving strong trough across the Midwest and East. Other operational models line up with a bulk of available ensembles pointing more toward a persistent Rockies trough. Teleconnection patterns are favor extreme cold limited to Western Canada and warmer conditions in the South and East. A consideration of all models along with teleconnections seem to indicate that today's operational American model is too cold for the Midwest and East late next week. A strong Hudson Bay Low will allow cold air to build across Canada but the active jet stream across the U.S. will keep it too stormy to allow much of this cold air to funnel very far south into the U.S.
- Models/Teleconnections/Pattern -> What's It Mean? There will be ample cold air across much of Canada over the next two weeks, especially from Alaska to the Front Range in British Columbia. An active storm track will bring highly variable temperatures from the Front Range of the Rockies across the northern tier of the U.S. Cooler than normal temperatures will primarily reside in the Rockies. The South and East will also remain stormy but the tendency will be for storms to track west of these regions allowing them to be near or above normal. There appear to be no threats for significant cold in the Midwest, South or East through at least late January.
- Specifics This Week -> Late Week Normalization: The extreme warmth of last week is gradually fading but temperatures will remain above normal from the Midwest to the Northeast to the South. A surge of cooler air will move southward late this week normalizing temperatures across the Midwest and Northeast. Temperatures will be on the cool side from the Rockies to the West Coast. This week will feature several storms across the U.S. but no significant snow is expected in the major population centers east of the Rockies. Wet conditions will redevelop quickly in the Northwest and along the West Coast.
- Specifics Next Week -> No Strong Midwestern or Eastern Cold: A stormy pattern will continue with brief surges of cool air in the Midwest but limited cold for the South and East. The coldest part of the nation will remain across the Rockies where temperatures will be mainly normal to below normal. Normal temperatures will spread out across the northern Plains and much of the Midwest will be closer to normal but overall temperatures will be normal to above normal from the Ohio Valley to the South to the East Coast. The stormy pattern will continue to bring ample precipitation from the Rockies to the Midwest to the East.
